Description

An agri-environment package for a polinator-friendly farmland

Evidence-based proposal of a flexible, straightforward package of agri-environment measures for farmers, targeting pollinators / insects. Existing and proposed measures prioritized / scored to define a new package.

Wild pollinators are strongly limited by the availability of floral and nesting resources. Since farmland roughly accounts for half of the country, it is crucial to improve the quantity and quality of resources in these areas. A set of agri-environment options specifically aiming at supplying sufficient resources to support a range of wild pollinators in Luxembourg (a "Wild Pollinator Package") should be designed based on detailed information on their ecological requirements in order to increase its effectiveness. Specific options within the existing agri-environment schemes that could support pollinators should be identified during an exercise involving different stakeholders and scored by importance and certainty based on best available evidence (i.e., scientific evidence and/or a rigorous process for compiling expert judgement). Crucial management actions not covered by current agri-environmental schemes should be proposed. The package should be built on such an evidence-based assessment, yet it should be simple, flexible and straightforward to implement. Farmers should be (financially) supported to take up the package through agri-environment schemes and advice. Moreover, the effectiveness of such a package for wild pollinators should be monitored, as it is expected to vary with the landscape context.

De quelle manière cette mesure aide-t-elle les insectes pollinisateurs ?

The role of pollinators in food production largely takes place on farmland. The project aims to identify a set of agri-environment options that provide food and nesting resources specifically for pollinators.

Quel(s) acteur(s) pour la mise en place ?

LIST, MECDD, Ministry of Agriculture, farming organisations, academics and other stakeholders, conservation groups.
